To investigate the effect of 24.95% 4.0% error.

A marked pixel in Figure (a) chooses one of the representative colors. Figure (b) shows the distance between the representative colors at each pixel. Figure (c) measures demosaicing error.

The Effect of \( \eta \) on \( \text{PSNR} \)

24 scaled-down images from the Kodak PhotoCD are used as the sample set. Sample images filtered by the Bayer filter are used as simulated inputs to the algorithms.

A Java experimental framework is developed to facilitate the research.

2. To investigate the effect of \( \eta \), a configurable parameter in the two color prior method
3. To improve the two color prior Bayesian demosaicing algorithm

24 scaled-down images from the Kodak PhotoCD are used as the sample set. Sample images filtered by the Bayer filter are used as simulated inputs to the algorithms.

A Java experimental framework is developed to facilitate the research.
